phosphatase-beta (PAP-beta), an enzyme that caralyses the conversion of phosphataldic acid into diazylglycerol. 3 Variants of human PAP, i.e. PAP-beta alpha 1 and 2 (see AAW79284-85) PAP-beta (see AAW79286) and PAP-gamma (see AAW79287) have been identified. The invention provides PAP polynucleotides (see AAW69086-89) and polypeptides, a method of preparing polynucleotides (see AAW69086-89) and polypeptides, a method of preparing dephosphorylate a substrate, especially lysophosphatidic acid, ceramide 1-phosphate or sphingosine 1-phosphate, particularly for production of diacyglycerol, but also monoacylglycerol, ceramide and sphingosine. PAP is able to control the balance of lipid mediators of cellular activation and signal transduction. Sequences that encode PAP are potentially subplicesors, PAP-alpha is expressed at lower levels in cancer cells than in normal cells of same tissue type), inflammatory disease and diabetes-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention discloses a composition comprising two or more isolated rat

```
that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polymuclocide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the neurosition, a method for producing a pharmaceutical composition, a method for producing a pharmaceutical composition, a method for identifying a compound or small molecule that regulates the activity in an animal of one or more of the polypeptides given in the application, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more polypeptides or their antibodies. The polymucleotide or the compound that modulates its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (Chung), chronic constriction injury (CI) and spared nerve injury (SNI) in an animal (e.g. gene the specification) which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
or human polynucleotides or a polynucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polynucleotide sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New substantially pure Tau-related polypeptides and polynucleotides, useful for diagnosing and/or treating neurological conditions with aberrant expression of the Tau-related polypeptide, such as Alzheimer's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Tau; PPAP2A; PPAP2B; IHPK1; IHPK3; IHPK2; FLJ20530; DJ434014.5; EZF1; Loc127424; Loc113179; KIAA0826; neuroprotective; nootropic; antiparkinsonian; tau-protein kinase; human.

The invention relates to tau-related polypeptide consisting essentially of an amino acid sequence selected from PPAP2A, PPAP2B, IHPK1, IHPK3, IHPK2, FLJ20530, DJ434014.5, EZFT, LOC127424, LOC13119 and KTAA0826 (ADM72102-ADM72112 respectively). The methods and compositions of the present invention are useful for the diagnosis and/or treatment of neurological diseases or conditions associated with aberrant expression or activity of the Tau-related polypeptide, such as Alzheimer's disease and Parkinson's disease. The present sequence represents a human tau-related polypeptide homologue PPAP2B.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to novel polynucleotide and polypeptides for treating psoriasis or a sequence having at least 80\% identity to the above sequences. The nucleic acid is useful for preparing a composition for diagnoshing or treating psoriasis in a mammal. This sequence corresponds to one of the polypeptides of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New PRO nucleic acid or polypeptide, useful for preparing a pharmaceutical composition for diagnosing or treating psoriasis in a

The invention legaces to a novel isolated interface and the face of color polypeptide encoded by it. A protein of the invention has antidiabletic, dermatological, antipportatic, antidiabletic, dermatological, antipportatic, antidiabletic, dermatological, antipportatic, appropried and agonist, antidiabletic, dermatological, antipportatic, appropried, is an agonist, or antibody that specifically binds to the color polypeptide is useful for treating an immune related disorder such as systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, inventic arcoinca arthritis, a spondyloarthropathy, systemic sclerosis, an idiopathic inflammatory myopathy, Sjogren's syndrome, systemic sclerosis, autoimmune haemolytic anaemia, autoimmune transpections in thrombocytopenia, thyroiditis, diabetes mellitus, immune-mediated renal disease, a demyelinating disease of the central or peripheral nervous system, idiopathic demyelinating polyneuropathy, Guillain-Barre syndrome, a chronic inflammatory demyelinating polyneuropathy, a hepatobiliary disease, infectious or autoimmune chronic active hepatitis, primary chilary cirthosis, granulomatous hepatitis, sclerosing cholangitis, inflammatory bowel disease, gluten-sensitive enteropathy, Whipple's confisease, arthme allergic rhinits, atopic dermatitis, food disease, asthma, allergic rhinits, atopic dermatitis, food disease, asthma, allergic rhinits, atopic dermaticis, human-mediated and propertice of the lung, human-mediated and mediated and propertice of the lung, human-mediated and mediated and propertice of the lung, human-mediated and mediated and media
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  eosinophilic pneumonia, idiopathic pulmonary fibrosis, hypersensitivity pneumonitis, a transplantation associated disease, graft rejection or graft-versus-host disease. The present sequence represents a PRO protein

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            specificity for prenylphosphoric acid, applicable in mass-production of all-trans-prenyl alcohols by culturing transformants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a novel phosphatase polypeptide, exhibiting substrate-specificity for not less than 15C prenylphosphoric acid. The polymucleotides and encoded polypeptides are applicable in mass-production of all-trans-prenyl alcohols. The sequence represents a rat phosphatase polypeptide of the invention

The invention discloses a composition comprising two or more isolated rate or human polynucleotides or a polynucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also clasimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a service that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the expression of a polynucleotide sequence which is differentially compound that regulates the activity of one or more of the compound that regulates the activity of one or more of the compound for identifying a compound that regulates the activity of one or more of the specification, a method for identifying a compound useful in treating complaints for identifying a compound useful in treating complaints of the intenting compound that regulates the activity is useful for preparing a medicament for treating colypeptides or their antibodies. The polynucleotide or the compound that compound that end a pharmaceutical composition comprising the one or more compound that colympatides or their antibodies. The polynucleotide or the compound that colympatides or their antibodies. The polynucleotide or the compound that in the compound that modulates its activity is useful for preparing a medicament for treating colympatides or their antibodies. The polynucleotide or the compound that injury (CCI) and spared nerve injury (SNI) in an animal (e.g. gene the specification) which is differentially expressed during pain. Note:

The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at the p
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.

provides novel modular secreted proteins from Plasmodium berghei. The invention provides novel modular secreted proteins from Plasmodium falciparum (FPSR) and Plasmodium yoelili (PySR) that are post-cranslationally modified in sporozoites. These include Limulus clotting factor, lipid binding, scavenger receptor cysteine-rich and pentraxin comains. Homologues were identified in Plasmodium knowlesi (FXSR).

Comains. Homologues were identified in Plasmodium knowlesi (FXSR).

Clasmodium chabaudi (PCSR) (Cryptosporidium parvum (CPSR). Toxoplasma condii (TGSR) and Theileria parva (TPSR). PbSR, PfSR and PySR are from a unique and previoually unrecognized family contenting domains associated with binding and modulating host proteins involved in immunity. They are the first proteins from Plasmodium which are secreted and which show a condition phenotype in Doth vertebrate and mosquito, making them highly useful for the production of malaria vaccines. Transgenic PbSR unll mutants have attenuated growth in immunocompetent mice. They fail to produce sporozoites in Anopheles stephensi mosquitoes and consequently are dead-end parasites in the midgut of the mosquitoes and consequently are dead-end parasites in the midgut of the mosquitoes and consequently claimed methods for the detection/diagnosis of malaria, and are also used in vaccine compositions. Agents capable of antagonising, inhibiting or interfering with the function or appression of the secreted protein are used in the treatment and/or prophylaxis of malaria
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New secreted proteins from malarial parasites (e.g. Plasmodium falciparum), useful for detecting or diagnosing malaria, or as a vaccine or medicament for the treatment and/or prophylaxis of malaria.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is the protein sequence of novel secreted protein
                                                                                                                                                                                                                                                                                                                                                                                                                                  Trueman HE;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a non-naturally occurring peptide of Mycobacterium tuberculosis comprising an amino acid sequence of Mycobacterium tuberculosis comprising an amino acid sequence corresponding to an anion pump protein. The invention also relates to a non-naturally occurring nucleic acid corresponding to a DNA sequence of Mycobacterium tuberculosis or Nycobacterium leprae. The new peptide is useful as a vaccine against Mycobacterium leprae. The new peptide is cresponse. The peptide may also be used to detect hypersensitivity reactions of individuals exposed to Mycobacterium tuberculosis or Mycobacterium leprae. The peptide may also be used to detect hypersensitivity reactions of individuals exposed to Mycobacterium tuberculosis or Mycobacterium leprae. The proteins and peptides may be affixed to solid supports to detect antibodies typical of hypersensitivity reactions, from a patient, s sera. This sequence represents Mycobacterium tuberculosis non naturally occurring peptide of the invention. Note: The sequence data obtained in electronic format directly from USPPO at sequence. Thus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chomosome and gene mapphing, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal cativity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in issue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. AEG00010-AEG30377 represent novel human diagnostic amino acid sequences. AEG00010-AEG30377 represent novel human diagnostics amino acid sequences. AEG00010-AEG30377 represent novel human diagnostics amino acid sequences of the invention. Note: The sequence data for this
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

The invention relates to movel isolated human secreted polypeptides (I) and (II) are useful for treating and polynucleotides (II). (I) and (II) are useful for treating inflammatory conditions such as arthritis, mephritis, Crohn's disease, inflammatory conditions such as arthritis, mephritis, Crohn's disease, inchaemia-reperfusion injury, shock, sepsis, immune responses, and is involved in increasing haematopoiesis, stem cell survival, bone growth and remodeling. (I) (II) and modulators of (II) are useful for creating transpenic animals useful for studying the in vivo activities of creating transpenic animals useful for studying the in vivo activities of the polypeptide as well as for studying modulators of the polypeptides.

CC the polypeptide as well as for studying modulators of the polypeptides.

CC the polypeptide as well as seful for the treatment of central and and brain tissue and is useful for the treatment of central and peripheral nervous system diseases and neuropathies, such as Alzheimer's, Parkinson's disease, Huntington's disease, and amyotrophic lateral selectoris. In addition, (1) is involved in chemotractic or chemokinatic activity, regulation of hematopolesis and is useful for treating myeloid cell disorders, platelet disorders such as thrombocytopenia and for regenerating of bone, cartilage, tendon, ligament and/or nerve, for treating osteoporosis, osteoarthritis, bone degenerative disorders, or periodontal disease. Purthermore, (I) is also useful for gut protection or regeneration and treatment of lung or liver fibrosis, croperfusion injury in various itsuese, various immune deficiencies and crompal infections, autoimmune disorders e.g. multiple sclerosis, croperfusion injury, in various itsuese, various immune deficiencies and croditions, such as asthma or other respiratory problems. Croperfusion and conditions, such as asthma or other respiratory problems. Croperioric plantal cate as an antique of detary fat, libid, procein, cartholym stepres an antique of activity and can act as an antiqu
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Zhou P;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a novel isolated polynucleotide and the encoded polypeptide. The molecules of the invention demonstrate antinflammatory, neuroprotective, antianaemic, cytostatic and vulnerary activities and may be useful in preparing a composition for diagnosing or treating inflammatory, haematopoietic, immune, neurodegenerative or stem cell disorders, such as aplastic anaemia or cancer, as well as for promoting wound healing. The molecules may also be utilised during gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Z, Ma Y;

```
The invention relates to an isolated NOVX polypeptide (of 44 disclosed)

C comprising its mature form, a sequence having at least 95% sequence

identity to NOVX or a sequence comprising one or more conservative

substitutions in the amino acid sequence of NOVX. Also included are a

composition comprising NOVX and a carrier, a kit comprising, in one or

CC more containers, the composition, a method of identifying an agent that

Dinds to NOVX, a method for identifying a potential therapeutic agent for

aberrant physical interactions of NOVX, a method for screening for a

aberrant physical interactions of NOVX, a method for screening for a

method of treating or preventing a pathology associated with NOVX or a

method of treating or preventing a pathology associated with NOVX or a

pathological state in a mammal, an isolated nucleic acid molecule

composition to a disease associated with altered levels of

a cell comprising the vector, an antibody that immunospecifically binds

concing a NOVX protein, a vector comprising the nucleic acid molecule

concoling a NOVX protein to a disease associated with altered levels of

concoling a NOVX or the nucleic acid molecule in a sample, a method for determining the presence

cof or predisposition to a disease associated with NOVX. The polypeptides

cof or predisposition to a disease associated with NOVX. The polypeptides

concoling a method of producing NOVX (comprising culturing the cell

concoling acid molecules are useful in disease, Altheimer's

cunder conditions that lead to expression of the polypeptides

concoling diseases or conditions, e.g. audiciament for treating or

preventing diseases or conditions, e.g. audiciament disease, Altheimer's

disease, stroke, allergies, Parkinson's disease, Muntington's disease,

parasitic infections (many more diseases and diseases and diseases and diseases and diseases and diseases and diseases.

parasitic infections (many more diseases and diseases and diseases.)

parasitic infections (many more diseases and diseases and diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human, NOVX; autoimmune disease; Alzheimer's disease; stroke; allergy;

Patturajan M,

```
The invention relates to an isolated NOVX polypeptide (of 44 disclosed)

comprising its mature form, a sequence having at least 95% sequence
identity to NOVX or a sequence comprising one or more conservative
substitutions in the amino acid sequence of NOVX. Also included are a
composition comprising NOVX and a carrier, a kit comprising, in one or
more containers, the composition, a method of identifying an agent that
binds to NOVX, a method for identifying a potential therapeutic agent for
use in treatment of a pathology related to aberrant expression or
aberrant physiological interactions of NOVX, a method for screening for a
modulator of activity of or of latency or predisposition to a pathology
associated with NOVX, a method for modulating the activity of NOVX, a
method of treating or preventing a pathology associated with NOVX or a
pathological state in a mammal, an isolated nucleic acid molecule,
cacell comprising the vector comprising the nucleic acid molecule,
a cell comprising the vector, an antibody that immunospecifically binds
to NOVX, a method for determining the presence or amount of NOVX or the
nucleic acid molecule in a sample, a method with altered levels of
cypression of NOVX or the nucleic acid molecule in a first mammalian
subject and a method of producing NOVX (comprising rulturing the relation of the producing NOVX comprising culturing the cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New NOVX polypeptides and polynucleotides, useful in diagnosing, treating or preventing diseases or conditions, e.g. autoimmune disease, Alzheimer's disease, diabetes, graft versus host disease, cancer or viral or bacterial infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       under conditions that led to expression of the polypeptide). NOVX is useful in the manufacture of a medicament for treating a syndrome associated with a human disease associated with NOVX. The polypeptides and nucleic acid molecules are useful in disgnosing, treating or preventing diseases or conditions, e.g. autoimmune disease. Alzheimer's disease, stroke, allergies, Parkinson's disease, Huntington's diseases, multiple sclerosis, anxiety, pain, diabetes, graft versus host disease, pancreatitis, obesity, ulcers, anaemia, cancer, viral or bacterial and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Claim 2; SEQ ID NO 10; 342pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a novel method for determining if a nucleic acid is a marker for a predetermined phenotype/cell type of interest from a biological species. The method comprises performing a global comparison of a group of expressed sequence tags (ESTs) known to be expressed in the phenotype/cell type of interest with all ESTs expressed in normal tissue in order to identify ESTs that are preferentially expressed in the phenotype/cell of interest. A method of the invention is useful for determining whether a nucleic acid is a marker for a predetermined phenotype or cell type of interest from a biological species, preferably arbabiopsis or human. The cell type of interest is an abnormal cell such as a tumour cell, and the predetermined phenotype is a stress induced phenotype such as hyperosmotic stress or high salt conditions. A method of the invention is also useful for detecting a tumour cell, and for regulating or preventing the growth of a tumour cell. An antibody of the invention is useful for detecting a tumour cell, and for regulating or twoour-associated markers. A polypeptide of the invention is useful as an immunogen for vaccinating an animal. The present sequence represents a tumour-associated markers. A polypeptide of the invention is useful as an immunogen for vaccinating an animal. The present sequence represents a tumour-associated markers.
                                                                                                 ö
parasitic infections (many more diseases and disorders are listed in the specification). The present sequence represents a NOVX protein.
                                                                                                                                                                                                                                                                                                                                     human; marker; expressed sequence tag; EST; arabidopsis; tumour; stress-induced phenotype; hyperosmotic stress; colon cancer; immunogen;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

```
The invention relates to a novel isolated polynucleotide and the encoded polypeptide. The molecules of the invention demonstrate antinflammatory, neuroprotective, antianaemic, cytostatic and vulnerary activities and may be useful in preparing a composition for diagnosing or treating inflammatory, haematopoietic, immune, neurodegenerative or stem cell disorders, such as aplastic anaemia or cancer, as well as for promoting wound healing. The molecules may also be utilised during gene therapy procedures. The current sequence is that of a human therapeutic protein of the invention. The current sequence is not shown explicitly within the specification but can be accessed from the WIPO web-site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New polynucleotide, useful in preparing a composition for diagnosing or treating inflammatory, neurodegenerative or stem cell disorders, e.g., aplastic anemia or cancer for promoting wound healing.
                                                                                                                                                                                       antiinflammatory; neuroprotective; antianaemic; cytostatic; vulnerary; inflammatory; haematopoiesis; immunity; neurodegenerative; stem cell; aplastic anaemia; cancer; wound healing; gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Zhang J, Wehrman T, Wang

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention relates to novel, isolated full length human cDNA molecules and the encoded proteins thereof. Specifically, it refers to CDNA clones obtained by an oligo-capping method, where none of these clones are identical to any known human mRNAs. The present invention describes an immunoassay to identify agonists and antagonists, as well as antibodaes, antibo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New 1995 cDNA, useful for treating osteoporosis, neurological diseases, Alzheimer's diseases, Parkinson's diseases, dementia and various cancers.

The present sequence represents human neurotrypsin. Neurotrypsin proteins and polynucleotides can be used: (i) to inhibit tumours, including metaetsases, e.g. of brain or retina; (ii) to minimise tissue damage caused by stroke or brain injury (laving a protective effect on the penumbra zone); (iii) to treat or prevent neurodegeneration, increase survival of damaged neurons (e.g. in casses of hypoxia, ischaemia, nerve transection) and to stimulate regeneration and/or restoration of synapses; (v) to treat or prevent retinal disorders (e.g. degeneration or neoangiogenesis); (vi) to prevent apoptosis (or other causes of cell death) in the nervous system; (vii) to regenerate brain and/or nervous tissue; (viii) to reset pain; (ix) to improve brain performance, including learning and memory; (x) to treat or prevent a
                                                                               The present sequence is a serine protease designated BSSP-3, which is isolated from human brain tissue. Transformants may be used to produce the enzyme or its partial sequences. Products from the present invention are used for screening for potential peptide or non-peptide serine protease inhibitors or expression regulators for use as drugs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New human and murine neurotrypsin - used, e.g. for inhibiting tumours, treatment of neurological or lung disease, including by gene therapy and

                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a novel human polynucleotide and the encoded polypeptide. A polynucleotide of the invention may have a use in gene therapy. An oligonucleotide of the invention ADM06202-ADM06773 is useful as a primer for synthesizing the polynucleotide or as a probe for detecting the polynucleotide. The polynucleotides ADM0136-ADM03758 are useful in gene therapy, for developing a diagnostic marker or medicines for regulating their expression and activity, or as a target of gene therapy. The proteins ADM03759-ADM06201 encoded by the polynucleotides are useful as pharmaceutical agente. The present sequence represents a protein sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New serine protease expressed in brain tissue - used in screening for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a novel method for detecting soft tissue sarcoma which comprises obtaining a first soft tissue sample from an individual and a normal soft tissue sample from the same or different individual, determining the expression of a gene in both samples and comparing the expression of the gene in both soft tissue samples, where a higher level of protein expression in the first soft tissue sample indicates the presence of soft tissue sarcoma. The method of the invention has cytostatic applications and may be useful for detecting soft tissue sarcoma, possibly via gene therapy or vaccine production. The nucleic acid sequences may be useful in diagnostic and screening applications. The current sequence is that of a human soft tissue sarcoma-upregulated protein of the invention. The current sequence is not shown within the specification per se but was submitted in CD format by the inventor.
                                                                                                                                                                                                                                                                                                                                                                                                                                       soft tissue sarcoma; cytostatic; gene therapy; vaccine; screening; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Barly detection of soft tissue sarcoma comprises determining expression of a gene in a first soft tissue sample and a normal soft tissue sample and comparing the gene expression, also useful in treating soft tissue
wide range of psychiatric disorders; and (xi) to treat brain or lung injury associated with protease expression (specifically emphysema or bronchitis)

Or treating a subject having a urological disorder. Also described: (1) a method for identifying a compound capable of treating a urological disorder; (2) a method for identifying a subject having a urological disorder; and (3) a method for treating a subject having a urological disorder. The compound has uropathic and cytosteatic activities. The polypeptides related to urological disorders are useful for identifying a compound capable of treating a urological disorder. Busing a urological disorder. Incontinence and benign prostatic hyperplasis. The present sequence represents a number of isorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Use of polypeptides related to urological disorders, e.g. 44390, 54181, 211 or for identifying a compound capable of treating a urological disorder or identifying and treating a subject having a urological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes a chimeric bifunctional molecule (I)

comprising at least a first functional molecule covalently linked to a

second functional molecule, which is able to modulate the activity of the

permeability transition pore complex (PTPC) of the mitochondria. (I) has

the function of specifically targeting and entering a tissue call

population. The second functional molecule has the function of

specifically targeting, and inducing or preventing the death of the cells

by apoptosis by requiating the opening or the closing of the PTPC of the

mitochondria or its fragment. (I) has virucide, neuroprotective,

consortopic and cytostatic activities, and can be used as a mitochondrial

permeability transition pore complex (PTPC) modulator. (I) is useful for regulating cell death regulatory molecules, specifically the

spoptogenic function of the PTPC, for treating e.g. cancer, ischaemia,

neurodegenerative diseases, fulminant hepatitis or viral infections. The

present sequence represents a chimaric peptide which is given in the

exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a novel phosphatase polypeptide, exhibiting substrate-specificity for not less than 15C prenylphosphoric acid. The polymclectides and encoded polypeptides are applicable in mass-production of all-trans-prenyl alcohols. The sequence represents a rat phosphatase polypeptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

The invention discloses a composition comprising two or more isolated rat or human polynuclectides or a polynucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a array or that is differentially regulated in neutonal tissue of a first animal chais differentially expressed in neutonal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence which is differentially compound that regulates the activity of one or more of the compound that regulates the activity of one or more of the compound that regulates the activity of one or more of the compound that regulates the activity of one or more of the compound cor identifying a compound or small molecule that regulates the activity of one or more of the specification, a method for identifying a compound useful in treating compound that regulates its activity is useful for preparing a medicament for treating spain and a pharmaceutical composition comprising the one or more compound that compound that modulates its activity is useful for preparing a medicament for treating compulates its activity is useful for preparing a medicament for treating modulates its activity is useful for preparing a medicament for treating composition comprising the one or more composition comprising the compound that modulates its activity is useful for preparing a medicament for treating compuned that sequence data for this patent did not form part of the printed composition comprising the protein (shown in Table 2 of the specification) but was obtained in electronic form directly from wipo intypub/published_pot_engence or electronic form directly from wipo intypub.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Rat; pain; neuronal tissue; gene therapy; spinal segmental nerve injury; chronic constriction injury; CCI; spared nerve injury; SNI; Chung.

```
New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.
                             Recombinant DNA construct; transformed plant; improved plant p
cold tolerance; heat tolerance; drought tolerance; herbicide;

                                                                                                                                                                                                                                                                                                                                                                                                                          The invention discloses a composition comprising two or more isolated rate or human polynucleotides or a polynuclectide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the nucleic acid sequence. Also claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polynucleotide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the polynucleotides, a method for producing a pharmaceutical composition, a method for identifying a compound useful in treating sectivity in an animal of one or more of the activity in an animal of one or more of the activity in an animal of one or more of the activity in an animal of one or more of the polypeptides given in the specification, a method for identifying a compound useful in treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          pain and a pharmaceutical composition comprising the one or more polypeptides or their antibodies. The polynucleotide or the compound that modulates its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (Chung), chronic constriction injury (CCI) and spared nerve injury (Chung), chronic constriction therapy). The sequence presented is a rat protein (shown in Table 2 of the specification) which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                               New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polynucleotide encoding a polypoptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant having an improved property. The plant is a crop plant such as maize or sopbean. The method of producing a transformed plant cannot be marked property comprises transforming a plant with the recombinant DNA construct and growing the transformed plant, where the polynucleotide or polypeptide is useful for improving plant properties. The recombinant DNA construct is useful for improving plant properties. The recombinant DNA construct is useful for producing plants with improved plant properties, e.g. improved cold, heat or drought tolerance, colerance to hearbicides, extreme osmotic conditions or properties. Content, improved yield by modification of carbohydrate, introgen or content, improved yield by modification of carbohydrate, nitrogen or phosphorus use and/or uptake, by modification of groboynstes or by providing improved plant growth and development under at least one stress condition, improved plant growth and development under at least one stress condition, improved plants production or improved galactomannan production. This sequence represents a bacterial polypeptide used in the scope of the invention. Note: The sequence data for this patent did not form the form form or the form the printed specification but was obtained in electronic forms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         .

The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polymuclectide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant having an improved property. The plant is a crop plant such an improved property comprises transforming a plant with the crecombinant DNA construct and growing the transformed plant where the comprise or polypeptide is useful for improving plant with the recombinant DNA construct is useful for improving plant with the improved plant properties. The recombinant DNA construct is useful for improving plants with improved plant properties, e.g. improved cold, heat or drought tolerance, improved plant properties, e.g. improved cold, heat or drought tolerance, colerance to herbicides, extreme osmocic conditions, pathogens or pests, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of homologous recombination, modified seed oil or protein yield and/or content, improved yield by modification of carbohydrate, nitrogen or phosphorus use and/or uptake, by modification of photosynthesis or by providing improved plant growth and development under at least one stress condition. This sequence represents a bacterial polypeptide used in the grown remoner. The part of the printed specification but was obtained in electronic forms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.
                                                                                                                                                                                      cold tolerance; heat tolerance; drought tolerance; herbicide; osmosls; pathogen tolerance; pest tolerance; plant disease resistance; cell cycle pathway modification; plant growth regulator; homologous recombination; seed oil yield; protein yield; carbohydrate; nitrogen; phosphorus; photosynthesis; lignin; galactomannan; bacterial polypeptide.

The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant as maize or soppears. The method of producing a transformed plant cauch as maize or soppear. The method of producing a transformed plant cauch as maize or soppear. The method of producing a transformed plant cauch as maize or soppear. The method of producing a plant with the cecombinant DNA construct and growing the transformed plant, where the polynucleotide or polypeptide is useful for improving plant properties.

The recombinant DNA construct is useful for producing plants with improved plant properties, e.g. improved cold, heat or drought tolerance, colerance to hearbicides, extreme osmotic conditions or production of the cell cycle pathway with plant growth regulators, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased resistance to plant disease, better growth rate by modification of protein yield and/or content, improved yield by modification of carbohydrate, nitrogen or phosphorus use and/or uptake, by modification of photosynthesis or by providing improved plant growth and development under at least one stress condition, improved plant growth and development under at least one stress providing improved plant growth and development carbohydrate, nitrogen or production. This sequence represents a bacterial polypeptide used in the scope of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.
                                                                                                                                                                                                                                                                                                                                                          Recombinant DNA construct; transformed plant; improved plant property; cold tolerance; heat tolerance; drought tolerance; herbicide; osmosis; pathogen tolerance; pest tolerance; plant disease resistance; cell cycle pathway modification; plant growth regulator; homologous recombination; seed oil yield; protein yield; carbohydrate; nitrogen; phosphorus; photosynthesis; lignin; galactomannan; bacterial polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Chen X, Goldman BS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Claim 1; SEQ ID NO 15371; 122pp; English

strains, or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    03-OCT-2002
                                                                                                                                                                                                                                                                                                                     39

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibites proliferation of a cell. Also included are: (1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to an isolated nucleic acid comprising any one of

ö
proliferation; (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                             drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Antisense; prokaryotic essential gene; cell proliferation; drug design.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Zyskind JW;

The first sense sequences given in the specification where expression of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation, (7) identifying a compound that influences the activity of the gene in an operon required for proliferation, or that has an activity against a biological pathway or equired for proliferation, or that inhibits cellular proliferation of the particleration or the the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a gene required for collular proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound, 8 activity; (11) a culture comprising strains in which the gene product is overaxpressed or underexpressed; (12) determining the extent of proliferation of an organism. The antisense nucleic acids required for proliferation of an organism. The antisense nucleic acids required for cellular proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Antisense; prokaryotic essential gene; cell proliferation; drug design.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Zyskind JW;

The invention describes a new isolated nucleic acid encoding a Klebsiella pneumoniae polypeptide. Also described are: a recombinant expression vector comprising the nucleic acid, operably linked to a transcription regulatory element, and a cell comprising the recombinant expression vector. The nucleic acid is useful for preparing a vaccine composition against Klebsiella pneumoniae. This is the amino acid sequence of a Klebsiella pneumoniae polypeptide of the invention
                                                                                                                                                                                                                                           New nucleic acid encoding a Klebsiella pneumoniae polypeptide, useful for
preparing a vaccine composition against Klebsiella pneumoniae.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      PfSR; protein secretion; malaria; diagnosis; vaccine; antimalarial;

Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated on its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting callular proliferation or the activity of a gene in an operon required for proliferation or the activity of a gene in an operon required for proliferation; (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway or the proliferation, or that inhibits callular proliferation; (8) identifying a gene required for callular proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound sactivity; (11) a culture compound that inhibits proliferation of an organism acts; (13) identifying the target of a compound that inhibits the extent of to which each of the strains is present in a culture or collection of the proliferation of an organism. The antisense nucleic acids are useful for dentifying proteins or servening for homologue mucleic acids are useful for dentifying proteins or servening for homologue mucleic acids are useful for dentifying proteins or servening for homologue mucleic acids required for proverse and activity accepting the candidate molecules for rational
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                      New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. preumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at

The present sequence is the protein sequence of novel secreted protein PySR from the mouse malaria parasite, Plasmodium yoelii. The invention provides novel modular secreted proteins from Plasmodium falciparum (PfSR), Plasmodium berghei (PbSR) and P. yoelii (PySR) that are post-translationally modified in sporozoites. These include Limulus clotting factor, iljud binding, scavenger receptor cysteine-rich and pentraxin domains. Homologues were identified in Plasmodium knowlesi (PkSR), PkSR), PkSR are from a condium chabaudi (PcSR), Cryptosporidium parvum (CpSR), Toxoplasma (C gondii (TgSR) and Theileria parva (TpSR). PbSR, PfSR and PySR are from a culduque and previously unrecognized family containing domains associated with binding and modulating host proteins involved in immunity. They are the first proteins from Plasmodium which are secreted and which show a conference approaches from Phasmodium which are secreted and which show a conditive sporozoites in Anopheles stephensi mosquito, making them highly useful for the production of malaria vaccines. Transgenic PbSR null mutants have attenuated growth in immunocompetent mice. They fail to produce sporozoites in Anopheles stephensis mosquitoe. The novel concording for the mucleic acids encoding them, are used in the made methods for the detection/diagnosis of malaria, and are also used in vaccine compositions. Agents capable of antagonishig, inhibiting or interfering with the function or expression of the secreted protein are concording the treatment and/or prophylaxis of malaria
                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to novel genes (AAL34669-AAL37666) and proteins (ABB03087-ABB04109) associated with the musculoskeletal system useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Isolated polypeptide for treating, preventing and/ or prognosing disorders related to the musculoskeletal system including musculoskeletal cancers and also for testing and detection e.g. diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Claim 11; SEQ ID NO 2043; 781pp + Sequence Listing; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Ruben SM

The invention describes an isolated nucleic acid molecule comprising a sequence encoding musculoskeletal system associated polypeptides useful C for detecting disorders, e.g., cancer or cancer metastases, in animals or humans. The nucleic acid: stimulates re-vascularisation of ischaemic tissues associated with conditions such as thrombosis, arteriosclerosis, and other cardiovascular conditions; treats wounds due to injuries, burns, post-operative tissue repair, and ulcers; stimulates angiogenesis and limb regeneration; stimulates neuronal growth; can treat and prevent neuronal damage occurring in certain disorders or neurodegenerative conditions, such as, Alzhehmer's disease, Parkinson's disease, and AlDS-conditions, such as, and periodontal regeneration and aid in tissue transports or enhance bone and periodontal regeneration and aid in tissue transports or conditions skin aging due to sunburn by stimulates
CC enhance bone and periodontal regeneration and aid in tissue transports or conditions condition of hematopoietic cells and bone marrow cells activate hair-forming cells and promotes melanocyte growth; stimulates
CC growth and differentiation of hematopoietic cells and bone marrow cells transplantation or for supporting cell culture of primary tissues; induces tissue of mesodermal origin to differentiate in early embryonic cramplantation or for supporting cell culture of primary tissues; increases or decreases the differentiation or proliferentiate in early embryonic cramplantatics, such as, body height, weight, hair colour, eye colour, exemple the adipose tissue, pigmentation, size, and shape (e.g., skin, percentage of adipose tissue, pigmentation, size, and shape (e.g.,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Isolated nucleic acid molecules encoding musculoskeletal system associated polypeptides, useful for detecting disorders, e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Disclosure; SEQ ID NO 2043; 321pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Barash SC

ö
cosmetic surgery); modulates mammalian metabolism; changes mammal's metal state or physical state by influencing blorhythms, caricadic rhythms, depression, tendency for violence, tolerance for pain, reproductive capabilities, hormonal or endocrine levels, appette, libido, memory, or stress; increases or decreases storage capabilities, fat content, lipid, protein, carbohydrate, vittamins, minerals, cofactors or other nutritional components. This is the amino acid sequence of a novel human musculoskeletal system antigen. Note: The sequence data for this patent din oc form part of the printed specification, but was obtained in electronic format directly from the US patent office at the sequence.html?DocID=20020147140

The present invention relates to a method (M1) for producing one or more of a carbohydrate ester, protein ester, protein subunit ester or a hydroxy acid ester. M1 involves admixing an acyl donor, an acyl coeptor and water, where the acyl donor is a lipid substrate chosen from acceptor and water, where the acyl donor is chosen from from carbohydrate, and protein, and contacting the admixture with lipid acyltransferase, such that the lipid acyltransferase catalyses one or both of the alcoholysis or transsererification reactions. The lipid acyltransferase comprises the amino acid sequence motif ADR4163. (M1) enables bioconversion of lipids to form one or more of acabohydrate ester, protein ester, protein subunit ester or hydroxy acid ester, in a high water environment, which comprises no organic solvent or a reduced compared to lipolytic erzymes in that they have a marked properties when compared to lipolytic erzymes in that they have a marked properties when compared to lipolytic erzymes in that they have a marked properties when compared to lipolytic erzymes in that they have a marked production of esters at reduced cost, reduced human and/or environmental exposures to organic solvents, and simplification of the production of esters at reduced cost, reduced human and/or environmental exposures to organic solvents, and simplification of the production of the production of the production of esters produced by (M1) is useful in pharmaceutical, feedstuff and paint. The esters produced by (M1) are functionally important and useful emulsifiers that are used in food infortatry, cosmetics industry, feed industry. The emulsifiers are useful as wetting and pharmaceutical industry. The emulsifiers are useful as wetting agents, food ingredients and active ingredients. The esters produced by agents in the esters produced by Producing carbohydrate ester, protein ester, hydroxy acid ester, by admixing acyl donor e.g., phospholipid, acyl acceptor e.g., carbohydrate, contacting admixture with lipid acyltransferase for alcoholysis or Antimicrobial; fungicide; herbicide; insecticide; cytostatic; carbohydrate ester; protein ester; hydroxy acid ester; lipid acyltransferase; enzyme; pharmaceutical; cosmetic; foodstuff; Mikkelsen JD, ADR41635 standard; protein; 305 AA. are useful in personal hygiene products. The protein esters of (MI) are useful in shower and bath preparations and in shampoos and body cleanmeers. The protein-fatty acid condensates produces by (MI) form a protective layer on the skin, which reduces the excessive attack of surfactants on the upper layer of the skin, their strong degreasing cffect and the direct interaction of anionic surfactants with the skin. The carbohydrate esters produced by (MI) are useful in oral-care produced by (MI) are useful in oral-care produced by (MI) are useful in cosmetics including essential oil esters produced by (MI) are useful in cosmetics including essential oil cmulsions, ointment bases, agricultural including cleaners for fruit and vegetables, crop protection including insecticides and herbicides, and food industry including bread, cakes, chocolate, margarine, custard powder, and in drinks industry. The present sequence is one such lipid acyltransferase, used in the method of the invention.
                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Antiarteriosclerotic; Cardiant; Antilipemic; cholesterol; lipoprotein; emulsifier; foodstuff; lipid acyltransferase; enzyme; blood serum cholesterol; low density lipoprotein; atherosclerosis;

The present invention relates to a method (M1) for the in situ production of an emulsifier in a foodstuff, wherein a lipid acyltransferase (I) is

In situ production of emulsifier in foodstuffs, involves addition lipid acyltransferase to foodstuff.

            without increasing or without substantially increasing the free fatty acid in the foodstuffs. (I) also produces foodstuffs having improved emulaification. (I) comprises the motif ADR4613. (MI) or (I) is useful for in situ production of an emulaifier in a foodstuff. (I) is useful for preparing a foodstuff (e.g., egg-based products, salad dressings sauces, ice creams, egg powder, modified egg yolk or bread which in turn is useful for reducing blood serum cholesterol and/or to reduce low density lipoprotein, or for treating and/or preventing atherosclerosis and/or heart disease. (I) is useful for preparing medicament, flavouring agent and/or texturizer. (I) is useful for producing acylated proteins, cosmetic composition or food or feed enzyme composition. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention relates to a novel method for targeting disruption of an arbitrary gene in a genome of an organism which comprises providing the whole sequential data of the genome of such organism, selecting at least 1 arbitrary region in the sequence, providing a vector that contains a sequence homologous with the selected region and a marker gene, transformation, and homologous recombination. The genome is preferably the genome of a hyperthermostable archaebacterium, particularly Thermococcus kodakaraenais KODI. The method is for targeting the disruption of a gene in the genome of an organism, which is applicable in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Method for disrupting targeted gene in genome of organism particularly thermostable bacterium and with genome chips for analysis, applicable in studying gene structure and functions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           gene disruption, gene targeting, marker gene; transformation; homologous recombination; hyperthermostable archaebacterium, KOD1; gene structure; gene function; enzyme activity; medicine; foremsic science; food; drug inspection; molecular biology; immunology.

studying gene structure and functions as well as enzyme activities of encoded proteins and useful in medicine, forensic science, food or drug inspection, molecular biology and immunology. With this method, the disruption of a gene at an arbitrary position in a genome can be achieved efficiently and reliably. The present sequence is that of a protein encoded by the genome of Thermococcus kodakaraensis which was derived using the method of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New dual condensation/epimerization non-ribosomal peptide synthetase domain and encoding polymucleotide, useful for modifying the stereochemistry of synthesized peptides (e.g. ramoplanin or complestatin) in vitro or in vivo.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                non-ribosomal peptide synthetase; NRPS; dual condensation; epimerisation; ramoplanin; complestatin; actinomycetes taxon.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention relates to novel domains of non-ribosomal peptide synthetases (NRSS) that exhibit dual condensation and epimerisation activities. Specifically, these domains allow incorporation of non-proteinogenic substraces (e.g. D-amino acids) into peptide products. Furthermore, they can be used in vivo to modify the stereochemistry of synthesiaed peptides (e.g. ramoplanin or complestatin) at selected amino acid sites by the addition of non-chiral residues. The present invention describes the identification of isolated polynucleotide NRPS domains in various organisms from the actinomycees taxon, and the encoded polypeptides thereof, as well as suitable expression vectors. This polypeptide sequence is a dual condensation/ epimerisation NRPS domain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Actinomycetes dual condensation/epimerisation NRPS domain protein ID 21.
                                                                                                                                                                                                                                                                 Score 39; DB 8; Length 393;

The invention relates to a recombinant DNA construct comprising a prowide for expression of a polynucleoide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant having an improved property. The plant is a crop plant such as maize or soybean. The method of producing a transformed plant having an improved property. Omprises transforming a plant with the such as maize or soybean. The method of producing a transformed plant construct and growing the transforming a plant with the polynucleotide or polypeptide is useful for improving plant properties. The recombinant DNA construct is useful for producing plants with improved plant properties, e.g. improved cold, heat or drought tolerance, colerance to herbicides, extreme osmotic conditions, pathogens or pests, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of homologous recombination, modification of carbohydrate, nitrogen or content, improved yield by modification of carbohydrate, nitrogen or providing improved plant growth and development under at least one stress
                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.
                                                                                                                                                                                                                                                                                                                                                                     Recombinant DNA construct; transformed plant; improved plant property; cold tolorance; heat tolerance; drought tolerance; heat tolerance; pathogen tolerance; pathogen tolerance; pathogen tolerance; plant disease resistance; cell cycle pathway modification; plant growth regulator; homologous recombination; seed oil yield; protein yield; carbohydrate; nitrogen; phosphorus; photosynthesis; lignin; galactomanna; bacterial polypeptide.

The invention discloses a composition comprising two or more isolated rate or human polynucleotides or a polynucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the nucleic acid sequence. Also claimed are a vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polynucleotide sequence that is differentially expressed in neuronal lissue of a first animal subjected to pain, a method for identifying a compound which regulates the expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the compound that regulates the activity of one or more of the polynucleotides, a method for producing a pharmaceutical composition, a cerivity in an animal of one or small molecule that regulates the activity in an animal of one or small molecule that regulates the activity in an animal of one or more of the polypeptides given in the activity in an animal of one or more of the polypeptides given in the activity in an animal of one or more of the polypeptides given in the activity in an enthod for identifying a compound useful in treating
                                                                                                                                                                                                                ö
                   production. This sequence represents a bacterial polypeptide used in the scope of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format from USPTO at seqdata.uspto.gov/sequence.html.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Rat; pain; neuronal tissue; gene therapy; spinal segmental nerve injury; chronic constriction injury; CCI; spared nerve injury; SNI; Chung.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.
                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               pain and a pharmaceutical composition comprising the one or more
condition, improved lignin production or improved galactomannan

i,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention discloses a composition comprising two or more isolated rat or human polynuclectides or a polynuclectide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polynuclectide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polynucleotide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a differentially expression of a polynucleotide sequence which is differentially expression of a polynucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the
polypeptides or their antibodies. The polynucleotide or the compound that
               modulates its activity is useful for preparing a medicament for treating modulates its activity is useful for preparing a medicament for treating min (e.g., spinal segmental nerve injury (Chung), chronic constriction injury (CCI) and spared nerve injury (SNI) in an animal (e.g., gene therapy). The sequence presented is a rat protein (shown in Table 2 of the specification) which is differentially expressed during pain. Note: the sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.

WPI; 2001-616774/71. N-PSDB; AAS59608 Propionibacterium acnes polypeptides and nucleic acids useful for vaccinating against and diagnosing infections, especially useful for treating acne vulgaris.

Example 1; SEQ ID NO 21431; 1069pp; English.

Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by P. acnes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central

The invention also relates to polynetides encoded by the polynucleotides (ABM5524-ABM64536) and to immunogenic fragments of P. acnes polypeptides. The invention additionally encompasses expression vectors and host cells comprising a polynucleotide of the invention; antibodies against polypeptides of the invention; fusion proteins comprising a nimmune response specific for a P. acnes polypeptide and an isolated T cell population comprising T cells prepared
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New Propionibacterium acnes polypeptides and polynucleotides encoding the polypeptide, useful for diagnosing, preventing or treating acne vulgaris, or for stimulating an immune response specific for a P. acnes protein.
nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as dagnoscit agents for determining P. acnes presence, for example, by enzyme linked immunosorbent assay (ELISA). Note: The sequence data for this patent did not form part of the printed specification, but was betalined in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Maisonneuve JL;

conjuncted tides, antibodies, fusion proteins, T cell populations, or antigen-presenting cells that express the polypeptide); a method and kit for detecting or determining the presence or absence of P. acnes in a patient; and method for inhibiting the development of P. acnes in a patient. The P. acnes polypeptides, polymuclectides, antibodies, fusion proteins, T cell populations or antigen-presenting cells that express the polypeptides are useful for diagnosing, preventing or treating acne polypeptides are useful for diagnosing, preventing or treating acne collection. The polymuclectides can also be used as probes or primers for nucleic acid hybridisation. The vaccine composition is useful for the stimulating an immune response against P. acnes, or for treating acne, and the kit is useful for performing a diagnostic assay. The present sequence represents a polypeptide predicted to be encoded by an ORF (open reading frame) contained within the P. acnes polymuclectides of the cinvention. Note: The sequence data for this patent did not form part of the princed specification, but was obtained in electronic format directly from MIPO at ftp.wipo.int/pub/published\_pct\_sequences via this method; a vaccine composition (comprising P. acnes polypeptides, 8888888888888888888888888888888888

Gispecies: Salmonella enterica subsp. enterica serovar Typhi
A/Note: this species has also been called Salmonella typhi
Gispecies: Salmonella enterica subsp. enterica serovar Typhi
Gispecies: Delov-2001 #sequence_revision 09-Nov-2001 #text_change 18-Nov-2002
GiAccession: AB0617
